Branch Coverage Report

Team 13 | 9 November 2026 | Final verification on main

The source-file hashes are recorded in source-manifest.json. Raw outputs identify the actual environments and execution times.

Backend branch coverage

92.67% = 493 covered / 532 branch destinations.

There are 39 missed destinations and 37

partially exercised branch lines. These are measured gaps; the report does not claim 100%.

Method and interpretation

The same final full-suite run enabled --cov-branch. A branch destination is an outgoing path measured by coverage.py, including exceptional and defensive paths. No separate branch threshold was specified in the course Part 3 handout. The repository enforces an 80% combined gate and separately reports the required line target.

Coverage XML contains per-line condition coverage. Full-suite log lists missed paths.
